

# **TRIOYAK-30**

## **FUEL ADDITIVE-VANADIUM CONTROL**

**TRIOYAK-30;** It is used as a sediment exchanger in medium and high speed diesel machines using heavy fuel. It reduces especially the deposits of vanadium, sodium and sulfur in the exhaust valve bearings and turbocharger components.

### **PRODUCT FEATURES AND BENEFITS**

- It reduces deposits such as vanadium, sulfur and sodium.
- It minimizes corrosion at low and high temperatures.
- It saves energy by reducing fuel consumption.
- It prevents carbon formation and accumulation on the combustion surface.
- It prevents acid and low-temperature corrosion.
- It enables longer life of machine parts.
- The gaseous corrosive sulfur dioxide of the sulfur in the fuel then removes the corrosive effect by preventing the formation of sulfuric acid. It ensures long life of machine parts.

### **METHOD OF APPLICATION AND INTENDED USE**

It should be given regularly to the fuel pipe with the help of a dosing pump. The amount of use varies depending on the amount of sodium, sulfur and vanadium in the fuel. The amount of use is 1 lt for an average of 1-8 tons of fuel.

**NOTE: Please review the MSDS reports before use for safety, occupational health and safety.**
